

M2M OVERVIEW

M2M is simply defined as device networking. M2M connects machines to people, people to applications, and provides real-time information. This unlimited access to data allows business the ability to diagnose problems, monitor on-going performance, improve service to their customers and save time and money by automating repetitive processes and tasks.

The possibilities of unlimited communication are endless. M2M is changing the way humans, machines and technology work together for progress in business and in life.

M2M Applications tend to be industry or niche specific.

Applications

Automated Vehicle Tracking (AVL)

Companies controlling or using multiple vehicles know that efficiency of fleet operation is critical to business

Distributed Generation/ Combined Heat & Power (DG/ CHP)

Performance contractors' rely on the ability to measure and verify the success of their energy utilization programs, including CHP/DG systems

Energy Management

Effective energy management requires awareness of utility usage and cost, and how these relate to daily operations.

Data Center Monitoring

Protection of a company's data and uninterrupted information services are absolutely critical to business.

Security Monitoring

Businesses understand the importance of providing safety, and of protecting their facilities, equipment and inventory
